#### Abstract

A general method for the asymmetric synthesis of $\alpha$-substituted $\beta$-amino secondary alcohols is described, which comprises the four-reaction sequence (1) the proline-mediated, asymmetric, three-component Mannich reaction of two different aldehydes, (2) nucleophilic carbon addition to aldehyde, (3) oxidation of the resulting alcohol to the corresponding ketone, and (4) diastereoselective reduction with $\mathrm{LiAlH}(\mathrm{O}-t-\mathrm{Bu})_{3}$ or catecholborane. The former reductant afforded the $1,2-$ syn isomer, while the latter gave the 1,2 -anti isomer stereoselectively. The present method was successfully applied to the efficient asymmetric synthesis of the N -terminal amino acid moiety of nikkomycin B and $\mathrm{B}_{\mathrm{X}}$.

## 1. Introduction

$\beta$-Amino alcohols are not only found in many natural products ${ }^{1}$ and potent drugs, ${ }^{2}$ but are also used as a component of ligands in asymmetric catalysts. ${ }^{3}$ In spite of this synthetic utility, there are few methods for their asymmetric synthesis, which remains a considerable challenge. ${ }^{4}$ Recently, Ellman and co-workers reported an asymmetric synthesis of both syn and anti $\beta$-amino alcohols based on the diastereoselective reactions of metalloenamines derived from chiral $N$-sulfinyl imines, followed by the diastereoselective reduction, for which an equimolar amount of the chiral auxiliary is necessary. ${ }^{4 d}$ The development of a general and practical method for the synthesis of chiral $\beta$-amino alcohols based on catalytic asymmetric reactions is an important goal.

List reported a proline-mediated asymmetric Mannich reaction in 2000, ${ }^{5}$ after which organocatalyst-mediated asymmetric Mannich reactions have been investigated by several research groups. ${ }^{6}$ Our group have applied highpressure induced by water freezing to the proline-mediated Mannich reaction, widening the generality of the reaction. ${ }^{7}$

[^0]During the application of the high pressure to other prolinemediated reactions, we have discovered a proline-mediated, one-pot, three-component, cross-Mannich reaction involving two different aldehydes and $p$-anisidine proceeding at ambient pressure. ${ }^{8}$ That is, in the presence of proline an aldehyde and anisidine react to give the corresponding imine, which reacts with a second, different aldehyde, affording an $\alpha$-substituted $\beta$-amino aldehyde. As this $\beta$-aminoaldehyde is unstable, it is reduced immediately to give an $\alpha$-substituted $\beta$-amino primary alcohol in good yield with excellent syn selectivity and enantioselectivity (Eq. 1). The similar Mannich reaction has been reported also by Barbas ${ }^{, 6 \mathrm{i}}$ and Cordova's ${ }^{6 k, u}$ groups, independently. The $\alpha$-substituted $\beta$-amino aldehyde that was generated is a versatile synthetic intermediate, which can be further transformed to give the corresponding $\alpha$-substituted $\beta$-amino secondary alcohols with a generation of a new chiral center by formation of a carbon-carbon bond. The utility of the present method is further demonstrated by an efficient formal asymmetric total synthesis of nikkomycin, which is also described in this full paper.

## 2. Results and discussion

We have reported the proline-mediated, three component coupling Mannich reaction of benzaldehyde, propanal, and anisidine to afford an unstable, $\alpha$-substituted $\beta$-amino aldehyde, which was reduced to an $\alpha$-substituted $\beta$-amino primary alcohol with $\mathrm{NaBH}_{4}$ in $90 \%$ yield with high syn selectivity and excellent enantioselectivity (Eq. $1, \mathrm{R}^{1}=\mathrm{Ph}$, $\mathrm{R}^{2}=\mathrm{Me}$, syn/ant $i=>95: 5,98 \%$ ee). ${ }^{8}$ This result indicates that the $\beta$-amino aldehyde is generated as intermediate in very high optical purity. By employing an organo-metallic nucleophile instead of $\mathrm{NaBH}_{4}$, a $\beta$-amino secondary alcohol would be prepared, generating a new chiral center. With this scenario in mind, in a preliminary trial we examined the introduction of a methyl group, using MeMgI as nucleophile (Eq. 2). The reaction was performed as follows: the crude $\beta$-amino aldehyde generated as above was treated with MeMgI in $\mathrm{Et}_{2} \mathrm{O}$ at $-78^{\circ} \mathrm{C}$ for 4 h , generating 4-amino-butan-2-ol derivative 2a in 30\% yield, as a $1: 1$ mixture of syn and anti isomers (Table 1, entry 1). As both the yield and diastereoselectivity of this reaction were insufficient, other organometallic reagents were examined, with the results summarized in Table 1.

Though the moderate yields were obtained in the cases of MeLi and $\mathrm{MeTi}(\mathrm{O}-i-\mathrm{Pr})_{3},{ }^{9}$ diastereoselectivity was low

However, in spite of the successful results using methyl nucleophiles, aryl nucleophiles such as phenyl metal reagents gave disappointing results (Eq. 3). Though the syn isomer predominated with $\mathrm{Ph}_{3} \mathrm{ZnLi}$, the use of $\mathrm{Ph}_{2} \mathrm{CuLi}$ gave equal amounts of syn and anti isomers. As antiselective introduction of the aryl group had not proved successful, a new general method for the stereoselective formation of syn and anti $\beta$-amino secondary alcohol was investigated. Thus, the two-step protocol of oxidation followed by stereoselective reduction was investigated, for which phenyl-substituted $\beta$-amino alcohol 2b was selected as a model.

(entries 2 and 3). The anti isomer was obtained predominantly in good yield in the case of $\mathrm{Me}_{2} \mathrm{CuLi}^{10}$ (entry 4), while the syn isomer was generated predominantly in the reactions of $\mathrm{MeCeCl}_{2}{ }^{11}$ and $\mathrm{Me}_{4} \mathrm{AlLi}^{12}$ (entries 5 and 6). When $\mathrm{Me}_{3} \mathrm{ZnLi}^{13}$ was used, the syn isomer was generated selectively (83:17) in good yield (entry 7). Thus either anti or syn isomers could be selectively synthesized by the proper choice of metal. Namely, $\mathrm{Me}_{2} \mathrm{CuLi}$ gave anti isomer, and $\mathrm{Me}_{3} \mathrm{ZnLi}$ afforded syn isomer predominantly, though the selectivities were only moderate.

Table 1. The effect of reagent on diastereoselectivity ${ }^{a}$

| Entry | Reagent | Time (h) | Yield (\%) $^{\text {b }}$ | Syn:anti $^{\text {c }}$ |
| :--- | :--- | :--- | :--- | :--- |
| 1 | MeMgI | 4 | 30 | $50: 50$ |
| 2 | MeLi | 4 | 52 | $33: 67$ |
| $3^{\text {d }}$ | $\mathrm{MeTi}(\mathrm{O}-i-\mathrm{Pr})_{3}$ | 18 | 60 | $33: 67$ |
| 4 | $\mathrm{Me}_{2} \mathrm{CuLi}$ | 4 | 83 | $25: 75$ |
| $5^{\text {e }}$ | $\mathrm{MeCeCl}_{2}$ | 4 | 77 | $67: 33$ |

| 7 | $\mathrm{Me}_{3} \mathrm{ZnLi}$ | 4 | 82 | $83: 17$ |

[^1]Oxidation of 2b was successfully carried out using $\mathrm{SO}_{3} \cdot$ pyridine $^{14}$ to afford $\beta$-amino ketone $\mathbf{3 b}$ in $83 \%$ yield (Eq. 4). Diastereoselective reduction of $\mathbf{3 b}$ was investigated with a variety of reducing reagents (Eq. 5), the results of which are summarized in Table 2. When $\mathrm{NaBH}_{4}, \mathrm{LiAlH}_{4}$, and DIBAL were employed, the anti isomer was predominantly obtained (entries 1-3). In the presence of $\mathrm{LiAlH}(\mathrm{O}-t-\mathrm{Bu})_{3}$, the reaction took place with excellent anti selectivity and quantitative yield (entry 4). On the other hand, borane reagents afforded the syn isomer stereoselectively. In the case of catecholborane the syn isomer was obtained in good yield and excellent diastereoselectivity (98:2) (entry 6). As both anti and syn isomers had been synthesized in high stereoselective manner by the use of $\mathrm{LiAlH}(\mathrm{O}-t-\mathrm{Bu})_{3}$ and catecholborane, respectively, the generality of these conditions was then examined.

Table 2. The effect of reducing agent on the diastereoselectivity of $\mathbf{2 b}$ formation

${ }^{\mathrm{b}}$ The diastereomeric ratio was determined by ${ }^{1} \mathrm{H}$ NMR.

First the synthesis of the starting $\beta$-amino ketone $\mathbf{3}$ was examined. The $\beta$-amino aldehyde was generated according to our asymmetric three-component Mannich reaction conditions, and then immediately treated with a lithium dialkyl- or diarylcuprate to afford $\beta$-amino alcohol 2. The oxidation of 2 with $\mathrm{SO}_{3}$ - pyridine gave $\beta$-amino ketone $\mathbf{3}$ (Eq. 6). The yields of $\mathbf{2}$ and $\mathbf{3}$ are summarized in Table 3, which shows that $\mathbf{3}$ was easily obtained in good yield from commercially available compounds.

The stereoselective reduction of $\beta$-amino ketones was examined using $\mathrm{LiAlH}(\mathrm{O}-t-\mathrm{Bu})_{3}$ and catecholborane (Table 4). In the case of $\mathrm{LiAlH}(\mathrm{O}-t-\mathrm{Bu})_{3}$, the $1,2-a n t i$ isomer was obtained stereoselectively in quantitative yield. This anti selectivity can be rationalized by intramolecular hydride transfer, as shown in Figure 1. A similar model was proposed by Evans and co-workers for the anti-selective reduction of $\beta$-hydroxy ketones employing tetramethylammonium triacetoxyborohydride. ${ }^{15}$ When catecholborane was employed as reducing reagent, the 1,2-syn isomer was generated, also with high to exellent diastereoselectivities and in good yield. The syn-selective reduction of $\beta$-hydroxy ketone with catecholborane ${ }^{16}$ can be explained using sixmembered chelation model (Fig. 2).

### 2.1. The determination of the stereochemistry

As reported in our previous paper (Eq. 1), ${ }^{8}$ the optical purity of the Mannich reaction of benzaldehyde, anisidine, and propanal, and that of $p$-bromobenzaldehyde, anisidine, and propanal were both excellent ( $98 \%$ ee). As the optical purity does not change during the oxidation and reduction processes, the $\alpha$-alkyl $\beta$-amino secondary alcohols are also obtained in excellent enantiomeric purity, as was confirmed for compound 15 (vide infra).

The relative stereochemistry of the alkyl and hydroxy groups of 2a was determined as following: the mixture of syn and anti isomers $\mathbf{2 a}$ was treated with $\mathrm{ClCO}_{2} \mathrm{Me}$ and DMAP, affording $\mathbf{4 a}$ as a mixture of diastereomers, which were separated by TLC. When $4 \mathbf{a}$ was treated with NaH in THF, no reaction occurred with the more polar isomer. On the other hand, the less polar isomer gave a cyclic urethane 5a, the stereochemistry of which was determined by NOESY spectra (Fig. 3). Thus, the configuration of the less polar isomer was determined to be 1,2-syn. The stereochemistry of phenyl-substituted 2b was also determined using the same method.

Figure 3. NOE observed in 5a.

nikkomycin B (6)

8

The synthesis starts with the Mannich reaction of 2-furylaldehyde. We had already found that the enantioselectivity of the Mannich reaction of 2-furylaldehyde was not satisfactory ( $84 \%$ ee). ${ }^{8}$ In order to improve the enantioselectivity, we investigated this particular reaction in detail and found that addition of pyridine increased the enantioselectivity (Eq. 9). That is, while $84 \%$ ee was obtained under the standard reaction conditions, excellent enantioselectivity ( $92 \%$ ee) was realized in the presence of

### 2.2. Formal total synthesis of nikkomycin

Nikkomycins B and $\mathrm{B}_{\mathrm{X}}$ are nucleoside peptide antibiotics isolated from the culture broth of Streptomyces tendae. ${ }^{17}$ They are potent chitin synthetase inhibitors, exhibiting fungicidal, insecticidal, and acaricidal activities. ${ }^{18}$ Because of these important biological properties, nikkomycins are attractive synthetic targets. The Konig ${ }^{19}$ and Barrett ${ }^{20}$ groups have accomplished the total synthesis of nikkomycins $B$ and $B_{X}$, respectively. The nikkomycins can be divided into two structural units, the C-terminal nucleoside amino acid and the N -terminal amino acid 8. The N-terminal amino acid 8 and its synthetic equivalent 9 contain the three contiguous stereocenters of an $\alpha$-methyl $\beta$-amino secondary alcohol moiety, the stereoselective synthesis of which is a synthetic challenge. Several methods to prepare this moiety in either racemic ${ }^{21}$ or optically active form ${ }^{22}$ have been reported. We have synthesized the N-terminal amino acid moiety 9 based on the method developed above, as will be described below (Fig. 4).
1.5 equiv of pyridine. It should be noted that this effect of pyridine was observed only in the reaction of 2-furylaldehyde, and no improvement in ee was seen for other aldehydes.

In the total synthesis of nikkomycin, we employed 4-tertbutyldimethylsiloxyaniline (11) instead of anisidine because the 4-tert-butyldimethylsiloxyphenyl moiety is easily cleaved from an amine under nearly neutral conditions (vide infra). ${ }^{7}$ The Mannich reaction of 2-furylaldehyde, propanal, and 4-tert-butyldimethylsiloxyaniline proceeded with high diastereo- and enantioselectivities ( $96 \%$ ee, vide infra). Crude $\beta$-amino aldehyde 12 was immediately treated with $\left(p-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right)_{2} \mathrm{CuMgBr}$ in THF at $-40^{\circ} \mathrm{C}$ to give $\beta$-amino alcohol 13. The crude mixture of syn and anti alcohols $\mathbf{1 3}$ was oxidized with $\mathrm{SO}_{3} \cdot$ pyridine to afford $\beta$-amino ketone 14 in $70 \%$ yield over three steps. These reactions could be easily scaled up because purification was performed only after the oxidation. Diastereoselective reduction of $\beta$-amino ketone 14 with $\mathrm{LiAlH}(\mathrm{O}-t-\mathrm{Bu})_{3}$ at $-78^{\circ} \mathrm{C}$ for 1 h proceeded smoothly,
generating 1,2-anti alcohol 15 in excellent yield and diastereoselectivity ( $98 \%, 1,2$-syn $/ 1,2$-anti $=1: 32$ ). The optical purity of the alcohol $\mathbf{1 5}$ was determined by chiral HPLC analysis and shown to be $96 \%$ ee. ${ }^{23}$ As the three continuous stereocenters had been established in a highly diastereo- and enantioselective manner, all that remained was oxidation of the furan to a carboxy group and transformations of the functional groups. However, the order of the reactions and the protecting groups used were found to be crucial for the successful transformation of $\mathbf{1 5}$ to 19, because of the presence of three oxidatively-labile moieties, the furan, $p$-methoxyphenyl and p-tert-butyldimethylsilyloxyaniline groups.

First, the hydroxy and amino groups were protected with the electron-withdrawing benzoyl group by treatment with benzoyl chloride, $\mathrm{Et}_{3} \mathrm{~N}$ and a catalytic amount of DMAP, affording 16 in $61 \%$ yield. The p-tert-butyldimethylsiloxyphenyl substituent on nitrogen was successfully removed by successive treatment with TBAF and iodobenzene diacetate in $78 \%$ yield over two steps. ${ }^{7}$ Iodobenzene diacetate is a mild oxidant, which afford the successful removal of the p-tert-butyldimethylsiloxyphenyl moiety without affecting the oxidatively-labile p-methoxyphenyl group and furan. In spite of several precedents for the conversion of furan into carboxy group, the oxidative modification of furan of $\mathbf{1 5}$ was found to be difficult. Though ozonolysis ${ }^{24}$ gave the product in low yield, the reaction of $\mathbf{1 7}$ with sodium periodate and a catalytic amount of ruthenium dioxide ${ }^{25}$ afforded the carboxylic acid, which was treated with diazomethane to

Scheme 1. Total synthesis of the N-terminal of amino acid equivalent 19 of nikkomycin $B$ and $B_{X}$.
afford methyl ester $\mathbf{1 8}$ in $47 \%$ yield over two steps. Even under these conditions over-oxidation at the $p$-methoxyphenyl moiety proceeded to some extent. Treatment of $\mathbf{1 8}$ with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in MeOH gave lactone 19 in $84 \%$ yield, which was identical to the literature ${ }^{21 \mathrm{~d}}$ (Scheme 1).

## 3. Conclusion

In summary, we have accomplished a general method for the synthesis of $\alpha$-substituted $\beta$-amino secondary alcohols based on the following sequence of four reactions. (1) The proline-mediated, asymmetric, one-pot, three-component cross Mannich reaction of two different aldehydes to generate $\alpha$-substituted $\beta$-amino aldehydes. (2) The nucleophilic addition reaction of $\mathrm{R}_{2} \mathrm{CuLi}$. (3) Oxidation of alcohol to ketone. (4) Diastereoselective reduction with $\mathrm{LiAlH}(\mathrm{O}-t$ $\mathrm{Bu})_{3}$ or catecholborane to generate the 1,2-syn or 1,2-anti isomer. This synthetic method was successfully applied to the formal total synthesis of the N -terminal amino acid moiety of nikkomycins $B$ and $B_{X}$.

## 4. Experimental

### 4.1. Typical experimental procedures for the preparation of 2 (Table 3, entry 1)

To a solution of benzaldehyde ( $53 \mu \mathrm{~L}, 0.5 \mathrm{mmol}$ ) and $p$-anisidine ( $67.8 \mathrm{mg}, 0.55 \mathrm{mmol}$ ) in NMP ( 0.5 mL ) was added L-proline ( $5.8 \mathrm{mg}, 0.05 \mathrm{mmol}$ ) and the reaction mixture was stirred for 2 h at room temperature. To this reaction mixture was added propanal ( $60.5 \mu \mathrm{~L}, 1.5 \mathrm{mmol}$ ) at $-20^{\circ} \mathrm{C}$, which was further stirred for 20 h at this temperature. After addition of phosphate buffer, the organic materials were extracted with $\mathrm{Et}_{2} \mathrm{O}$ three times and the combined organic phase was washed with brine three times, dried over $\mathrm{MgSO}_{4}$. After filtration, the volatile materials were removed under reduced pressure to afford a crude $\beta$-amino aldehyde, which was used immediately in the next reaction.

To a suspension of $\mathrm{CuI}(238 \mathrm{mg}, 1.25 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}$ $(2.5 \mathrm{~mL})$ was added $\mathrm{MeLi}\left(1.14 \mathrm{M}\right.$ in $\mathrm{Et}_{2} \mathrm{O}, 2.19 \mathrm{~mL}$, 2.5 mmol ) at $-20^{\circ} \mathrm{C}$ over 5 min and the reaction mixture was stirred for 30 min at that temperature. To a $\mathrm{Me}_{2} \mathrm{CuLi}$ solution was added a solution of crude $\beta$-amino aldehyde in $\mathrm{Et}_{2} \mathrm{O}(1 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ over 15 min and the reaction mixture was stirred for 3 h at this temperature. After addition of phosphate buffer and filtration of the insoluble materials via Celite pad, the organic materials were extracted with AcOEt three times and the combined organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude materials were obtained, which was purified by thin-layer chromatography (TLC) (AcOEt/hexane $=1: 3$ ) to afford $\beta$-amino alcohol 2a in $83 \%$ yield.

### 4.2. Typical experimental procedures for the preparation of 3 (Table 3, entry 1)

To a solution of $\beta$-amino alcohol $\mathbf{2 a}(205 \mathrm{mg}, 0.59 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.6 \mathrm{~mL})$ was added $\mathrm{Et}_{3} \mathrm{~N}(0.41 \mathrm{~mL}, 2.96 \mathrm{mmol})$, DMSO $(0.6 \mathrm{~mL})$ and $\mathrm{SO}_{3} \cdot$ pyridine $(278 \mathrm{mg}, 1.78 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$, and the reaction mixture was stirred for 30 min at that temperature. After addition of phosphate buffer, the organic materials were extracted with AcOEt three times and the combined organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude material was purified by TLC (AcOEt/hexane $=1: 3$ ) to afford $\beta$-amino ketone 3a in $94 \%$ yield.

### 4.3. Typical experimental procedures for the preparation of 2-anti by the reduction with $\mathrm{LiAlH}(\mathrm{O}-t-\mathrm{Bu})_{3}$ (Table 4, entry 1)

To a solution of $\mathbf{3 a}(10 \mathrm{mg}, 0.035 \mathrm{mmol})$ in THF $(0.5 \mathrm{~mL})$ was added a solution of $\mathrm{LiAlH}(\mathrm{O}-t-\mathrm{Bu})_{3}(1 \mathrm{M}$ in THF, $0.175 \mathrm{~mL}, 0.175 \mathrm{mmol}$ ) at $-78^{\circ} \mathrm{C}$ and the reaction mixture was stirred for 1 h at that temperature. After addition of a saturated solution of potassium sodium tartrate, the organic materials were extracted with AcOEt three times and the combined organic phase was washed with brine three times and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude materials were purified by TLC ( $\mathrm{AcOEt} /$ hexane $=1: 3$ ) to afford $\beta$-amino alcohol 2a quantitatively (2a-anti/2a-syn= 86:14). The ratio of anti/syn was determined by ${ }^{1} \mathrm{H}$ NMR measurement.

### 4.4. Typical experimental procedures for the preparation of 2-syn by the reduction with catecholborane (Table 4, entry 1)

To a THF solution ( 1.5 mL ) of $\mathbf{3 a}(50 \mathrm{mg}, 0.15 \mathrm{mmol})$ was added catecholborane $(155 \mu \mathrm{~L}, 1.5 \mathrm{mmol})$ at $-10^{\circ} \mathrm{C}$ and the reaction mixture was stirred for 3 h at that temperature. After addition of MeOH and a saturated solution of potassium sodium tartrate, the organic materials were extracted with AcOEt three times and the combined organic phase was washed with brine five times and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude materials were purified by TLC ( $\mathrm{AcOEt} /$ hexane $=1: 3$ ) to afford $\beta$-amino alcohol 2a in $90 \%$ yield (2a-anti/2a-syn $=2: 98$ ). The ratio of anti/syn was determined by ${ }^{1} \mathrm{H}$ NMR measurement.

### 4.5. The determination of the relative stereochemistry

4.5.1. (1S,2S,3S)-Carbonic acid 3-(p-anisidino)-1,2-dimethyl-3-phenylpropyl ester methyl ester (syn-4a). To a solution of $\mathbf{2 a}(75.7 \mathrm{mg}, 0.29 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(2.9 \mathrm{~mL})$ was added DMAP $(715.9 \mathrm{mg}, 5.86 \mathrm{mmol}), \mathrm{ClCO}_{2}-$ Me ( $453 \mathrm{~mL}, 5.86 \mathrm{mmol}$ ) at $0{ }^{\circ} \mathrm{C}$ and the reaction mixture was stirred for 2.5 h at room temperature. After addition of phosphate buffer, the organic materials were extracted with AcOEt three times and the combined organic phase was washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude material was purified by TLC (AcOEt/ hexane $=1: 3$ ) to afford syn-4a and anti-4a in $68 \%$ yield. Syn-4a and anti-4a were separated by TLC.

Yellow solid; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.99(3 \mathrm{H}, \mathrm{d}$, $J=6.8 \mathrm{~Hz}), 1.32(3 \mathrm{H}, \mathrm{d}, J=6.4 \mathrm{~Hz}), 1.93-2.02(1 \mathrm{H}, \mathrm{m})$, $3.66(3 \mathrm{H}, \mathrm{s}), 3.71(3 \mathrm{H}, \mathrm{s}), 4.40(1 \mathrm{H}, \mathrm{d}, J=4.8 \mathrm{~Hz}), 4.81$ $(1 \mathrm{H}, \mathrm{dq}, J=5.2,6.4 \mathrm{~Hz}), 6.41(2 \mathrm{H}, \mathrm{br} \mathrm{d}, J=8.9 \mathrm{~Hz}), 6.64$ $(2 \mathrm{H}, \mathrm{br} \mathrm{d}, J=8.9 \mathrm{~Hz}), 7.17-7.30(5 \mathrm{H}, \mathrm{m}) ;{ }^{13} \mathrm{C}$ NMR (150 MHz, $\mathrm{CDCl}_{3}$ ): $\delta 8.8,18.4,29.7,45.1,54.7,55.7,60.4$, $114.5,114.6,126.7,127.0,128.5,141.3,142.4,151.8$, 155.3; IR (neat): $\nu 3415,2981,2954,1743,1514,1442$, 1271, 1234, 1038, $820 \mathrm{~cm}^{-1}$; HRMS (FAB): calcd for $\mathrm{C}_{20} \mathrm{H}_{25} \mathrm{NO}_{4} 343.1784$, found 343.1816; $[\alpha]_{\mathrm{D}}^{21}-8.5$ (c 0.17, MeOH ).
4.5.2. (4S,5S,6S)-3-(p-Anisidino)-5,6-dimethyl-4-phenyl-[1,3]oxazinan-2-one (5a). To a solution of syn-4a $(25.6 \mathrm{mmol})$ in THF $(0.8 \mathrm{~mL})$ was added NaH $(8.95 \mathrm{mmol}, 0.373 \mathrm{mmol})$ at room temperature and the reaction mixture was stirred for 12 h at that temperature. After addition of phosphate buffer, the organic materials were extracted with AcOEt three times and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude material was purified by $\mathrm{TLC}(\mathrm{AcOEt} / \mathrm{hexane}=1: 1)$ to afford $\mathbf{5 a}$ in $25 \%$ yield.

Colorless solid; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.88(3 \mathrm{H}, \mathrm{d}$, $J=7.0 \mathrm{~Hz}), 1.38(3 \mathrm{H}, \mathrm{d}, J=6.5 \mathrm{~Hz}), 2.17-2.25(1 \mathrm{H}, \mathrm{m})$, $3.66(3 \mathrm{H}, \mathrm{s}), 4.85(1 \mathrm{H}, \mathrm{dq}, J=1.1,6.5 \mathrm{~Hz}), 5.26(1 \mathrm{H}, \mathrm{d}, J=$ $5.0 \mathrm{~Hz}), 6.68(2 \mathrm{H}$, br d, $J=8.6 \mathrm{~Hz}), 7.06-7.22(7 \mathrm{H}, \mathrm{m}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 6.8,18.1,37.8,55.2,67.3,75.9$, 113.7, 127.5, 127.9, 128.3, 133.8, 137.2, 154.2, 157.5; IR (neat): $\nu 2937,1689,1515,1454,1402,1247,1170,1033$, 1025, $833 \mathrm{~cm}^{-1}$; HRMS (FAB): $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{19} \mathrm{H}_{22} \mathrm{NO}_{3} 312.1600$, found 312.1622; $[\alpha]_{\mathrm{D}}^{20}-53.8$ (c $0.47, \mathrm{CHCl}_{3}$ ).

### 4.6. Experimental procedures of the formal total synthesis of nikkomycin

4.6.1. ( $2 S, 3 S$ )-3-(N-p-tert-Butyldimethylsiloxyphenyl-amino)-3-(2-furyl)-2-methyl-1-(p-methoxyphenyl)pro-pan-1-one (14). To a solution of 2-furylaldehyde $(0.25 \mathrm{~mL}$, 3.0 mmol ) and $p$-tert-butyldimethylsiloxyaniline $(737 \mathrm{mg}$, 3.3 mmol ) in NMP ( 3.0 mL ) was added L-proline ( 34.5 mg , 0.03 mmol ) and the reaction mixture was stirred for 2 h at room temperature. To this reaction mixture was added pyridine ( $0.363 \mathrm{~mL}, 4.5 \mathrm{mmol}$ ) and propanal $(0.972 \mathrm{~mL}$, 4.5 mmol ) at $-20^{\circ} \mathrm{C}$, which was further stirred for 20 h at this temperature. After addition of phosphate buffer, the organic materials were extracted with $\mathrm{Et}_{2} \mathrm{O}$ three times and the combined organic phase was washed with brine three times and dried over $\mathrm{MgSO}_{4}$. After filtration, the volatile materials were removed under reduced pressure to afford a crude $\beta$-amino aldehyde, which was used without further purification in the next reaction.

To a suspension of $\mathrm{CuI}(2.85 \mathrm{~g}, 15 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$ was added a solution of $p-\mathrm{MeOPhMgBr}\left(2.15 \mathrm{M}\right.$ in $\mathrm{Et}_{2} \mathrm{O}$, $14 \mathrm{~mL}, 30 \mathrm{mmol})$ at $-7^{\circ} \mathrm{C}$ over 5 min and the reaction mixture was stirred for 30 min at this temperature. To this reaction mixture was added a solution of crude $\beta$-amino aldehyde in $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{~mL})$ at $-7{ }^{\circ} \mathrm{C}$ and the reaction mixture was stirred for 3 h at this temperature. After addition of phosphate buffer and filtration of the insoluble materials via Celite pad, the organic materials were extracted with AcOEt three times and the combined organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude material was obtained, which was further oxidized.

To a solution of crude amino alcohol 13 in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{~mL})$ was added $\mathrm{Et}_{3} \mathrm{~N}(1.3 \mathrm{~mL}, 10 \mathrm{mmol})$, DMSO $(2 \mathrm{~mL})$ and $\mathrm{SO}_{3} \cdot$ pyridine $(937 \mathrm{mg}, 6 \mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$, and the reaction mixture was stirred for 30 min at this temperature. After addition of phosphate buffer, the organic materials were extracted with AcOEt three times and the combined organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of
the volatile materials under reduced pressure, the crude material was purified by column chromatography (AcOEt/ hexane $=1: 25$ ) to afford $\beta$-amino ketone 14 in $70 \%$ yield over three steps.

Yellow oil; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.10(6 \mathrm{H}, \mathrm{s})$, $0.92(9 \mathrm{H}, \mathrm{s}), 1.27(3 \mathrm{H}, \mathrm{d}, J=6.9 \mathrm{~Hz}), 3.84(3 \mathrm{H}, \mathrm{s}), 4.03(1 \mathrm{H}$, quintet, $J=6.9 \mathrm{~Hz}), 4.75(1 \mathrm{H}, \mathrm{d}, J=6.5 \mathrm{~Hz}), 6.09(1 \mathrm{H}, \mathrm{d}$, $J=3.2 \mathrm{~Hz}), 6.17(1 \mathrm{H}, \mathrm{dd}, J=2.0,3.2 \mathrm{~Hz}), 6.44(2 \mathrm{H}, \mathrm{br} \mathrm{d}$, $J=8.7 \mathrm{~Hz}), 6.58(2 \mathrm{H}, \mathrm{d}, J=8.7 \mathrm{~Hz}), 6.90(2 \mathrm{H}, \mathrm{d}, J=$ $8.8 \mathrm{~Hz}), 7.25(1 \mathrm{H}, \mathrm{d}, J=2.0 \mathrm{~Hz}), 7.90(2 \mathrm{H}, \mathrm{d}, J=8.8 \mathrm{~Hz})$; ${ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta-4.5,13.3,18.1,25.7$, $44.3,55.46,55.49,107.2,110.2,113.8,115.3,120.4,129.3$, 130.6, 141.4, 141.6, 148.0, 154.6, 163.6, 200.7; IR (neat): $\nu$ 3381, 2956, 2929, 1672, 1601, 1510, 1254, 1173, 924, $841 \mathrm{~cm}^{-1}$; HRMS (FAB): calcd for $\mathrm{C}_{27} \mathrm{H}_{35} \mathrm{NO}_{4} \mathrm{Si}$ 465.2335, found 465.2332; $[\alpha]_{\mathrm{D}}^{22}-37.6$ (c 0.39, $\mathrm{CHCl}_{3}$ ).
4.6.2. (1S,2S,3S)-3-( $N$-p-tert-Butyldimethylsiloxyphenyl-amino)-3-(2-furyl)-2-methyl-1-(p-methoxyphenyl)pro-pan-1-ol (15). To a solution of $14(673 \mathrm{mg}, 1.44 \mathrm{mmol})$ in THF $(14.4 \mathrm{~mL})$ was of $\operatorname{LiAlH}(\mathrm{O}-t-\mathrm{Bu})_{3}(1 \mathrm{M}$ in THF , $7.2 \mathrm{~mL}, 7.2 \mathrm{mmol}$ ) at $-78^{\circ} \mathrm{C}$ and the reaction mixture was stirred for 1 h at that temperature. After addition of the saturated solution of potassium sodium tartrate, the organic materials were extracted with AcOEt three times and the combined organic phase was washed with brine three times, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude material was purified by column chromatography (AcOEt/ hexane $=1: 15$ ) to afford $\beta$-amino alcohol 15 in $98 \%$ yield.

The ee was determined by the chiral HPLC analysis: Chiralpak AD-H column (hexane/2-propanol $=30: 1$ ), $0.5 \mathrm{~mL} / \mathrm{min}$, major $\mathrm{tr}=16.9 \mathrm{~min}$, minor $\mathrm{tr}=21.5 \mathrm{~min}$.

Pale yellow oil; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.13(6 \mathrm{H}, \mathrm{s})$, $0.84(3 \mathrm{H}, \mathrm{d}, J=7.4 \mathrm{~Hz}), 0.94(9 \mathrm{H}, \mathrm{s}), 2.41(1 \mathrm{H}, \mathrm{d}$ of quintet, $J=2.5,7.4 \mathrm{~Hz}), 3.80(3 \mathrm{H}, \mathrm{s}), 4.60(1 \mathrm{H}, \mathrm{d}, J=7.4 \mathrm{~Hz}), 4.79$ $(1 \mathrm{H}, \mathrm{d}, J=2.5 \mathrm{~Hz}), 6.05(1 \mathrm{H}, \mathrm{d}, J=3.2 \mathrm{~Hz}), 6.23(1 \mathrm{H}, \mathrm{dd}$, $J=1.8,3.2 \mathrm{~Hz}), 6.57(2 \mathrm{H}, \mathrm{br}$ d, $J=8.9 \mathrm{~Hz}), 6.64(2 \mathrm{H}, \mathrm{br}$ d, $J=8.9 \mathrm{~Hz}), 6.87(2 \mathrm{H}, \mathrm{br} \mathrm{d}, J=8.7 \mathrm{~Hz}), 7.27(2 \mathrm{H}, \mathrm{d}, J=$ $8.7 \mathrm{~Hz}), 7.29(1 \mathrm{H}, \mathrm{d}, J=1.8 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $(150 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta-4.5,12.5,18.1,25.7,43.4,54.6,55.2,106.7$, $110.1,113.8,116.0,120.6,127.5,128.3,136.0,141.2$, 141.4, 148.4, 155.4, 158.9; IR (neat): $\nu 3388,2956,2929$, 1610, 1508, 1250, 1009, 910, 837, $779 \mathrm{~cm}^{-1}$; HRMS (FAB): calcd for $\mathrm{C}_{27} \mathrm{H}_{37} \mathrm{NO}_{4} \mathrm{Si} 467.2492$, found 467.2493; $[\alpha]_{\mathrm{D}}^{22}-22.4\left(c 0.81, \mathrm{CHCl}_{3}\right)$.
4.6.3. (1S,2S,3S)-Benzoic acid 3-\{benzoyl-[4-(tert-butyl-dimethylsiloxy)-phenyl]-amino\}-3(2-furyl)-1-(4-methoxy-phenyl)-2-methylpropyl ester (16). To a solution of $\mathbf{1 5}$ ( $253.1 \mathrm{mg}, 0.541 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was added $\mathrm{Et}_{3} \mathrm{~N}$ $(0.679 \mathrm{~mL}, 4.87 \mathrm{mmol})$, benzoyl chloride $(0.377 \mathrm{~mL}$, 3.25 mmol ) and catalytic amount of DMAP at $0^{\circ} \mathrm{C}$. After stirring the reaction mixture for 18 h at room temperature, the reaction was quenched by the addition of phosphate buffer. The organic materials were extracted with AcOEt three times, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude
material was purified by thin-layer chromatography $(\mathrm{AcOEt} /$ hexane $=1: 3)$ to afford $\mathbf{1 6}$ in $61 \%$ yield.

Pale yellow solid; ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 0.06(6 \mathrm{H}$, s), $0.88(9 \mathrm{H}, \mathrm{s}), 1.34(3 \mathrm{H}, \mathrm{d}, J=6.7 \mathrm{~Hz}), 3.05-3.17(1 \mathrm{H}, \mathrm{m})$, $3.77(3 \mathrm{H}, \mathrm{s}), 5.85(1 \mathrm{H}, \mathrm{d}, J=10.7 \mathrm{~Hz}), 6.10(1 \mathrm{H}, \mathrm{d}, J=$ $4.5 \mathrm{~Hz}), 6.24-6.28(1 \mathrm{H}, \mathrm{m}), 6.41(1 \mathrm{H}, \mathrm{d}, J=4.1 \mathrm{~Hz}), 6.45-$ $6.54(4 \mathrm{H}, \mathrm{m}), 6.84(2 \mathrm{H}, \mathrm{d}, J=8.2 \mathrm{~Hz}), 7.05-7.20(7 \mathrm{H}, \mathrm{m})$, $7.28(1 \mathrm{H}, \mathrm{s}), 7.41(2 \mathrm{H}, \mathrm{t}, J=7.4 \mathrm{~Hz}), 7.53(1 \mathrm{H}, \mathrm{t}, J=$ $7.4 \mathrm{~Hz}), 8.02(2 \mathrm{H}, \mathrm{d}, J=7.4 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $(150 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ): $\delta-4.5,11.7,18.2,25.6,39.1,55.16,55.20,76.6$, $110.4,110.5,113.6,120.2,127.4,128.29,128.31,128.6$, 128.7, 129.0, 129.6, 130.4, 133.0, 136.5, 141.7, 151.6, 154.6, 159.3, 165.3, 170.7; IR (neat): $\nu 1718,1686,1655$, 1647, 1508, 1269, 1252, 912, $711 \mathrm{~cm}^{-1}$; HRMS (FAB): [ $\mathrm{M}-\mathrm{OBz}]^{+}$calcd for $\mathrm{C}_{34} \mathrm{H}_{40} \mathrm{NO}_{4} \mathrm{Si} 554.2726$, found: $554.2714 ;[\alpha]_{\mathrm{D}}^{22}-68.9$ (c 0.79, $\mathrm{CHCl}_{3}$ ).
4.6.4. (1S,2S,3S)-Benzoic acid 3-benzoylamino-3-(2-furyl)-1-(4-methoxyphenyl)-2-methylpropyl ester (17). To a solution of $\mathbf{1 6}(251 \mathrm{mg}, 0.371 \mathrm{mmol})$ in THF ( 7 mL ) was added a solution of tetrabutylammonium fluoride ( 1 M in THF, $0.445 \mathrm{~mL}, 0.445 \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$. After stirring the reaction mixture for 10 min at this temperature, the reaction was quenched by the addition of saturated $\mathrm{NH}_{4} \mathrm{Cl}$. The organic materials were extracted with AcOEt three times, and the combined organic phase was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude materials were used directly in the next reaction. To a $\mathrm{CH}_{3} \mathrm{CN}(1.02 \mathrm{~mL})$ solution of crude phenol derivative was added water $(0.5 \mathrm{~mL})$ and iodobenzene diacetate $(119.5 \mathrm{mg}$, 0.371 mmol ) at $0^{\circ} \mathrm{C}$. After stirring the reaction mixture for 1 h at that temperature, the reaction was quenched by the addition of solution of $\mathrm{NaHCO}_{3}$ and $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$. The organic materials were extracted with AcOEt three times, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude material was purified by thin-layer chromatography $\left(\mathrm{Et}_{2} \mathrm{O} /\right.$ benzene $\left.=1: 3\right)$ to afford 17 in $78 \%$ yield over two steps.

Colorless oil; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.90(3 \mathrm{H}, \mathrm{d}$, $J=7.1 \mathrm{~Hz}), 2.85(1 \mathrm{H}$, d of quintet, $J=3.5,7.1 \mathrm{~Hz}), 3.74$ $(3 \mathrm{H}, \mathrm{s}), 5.63-5.67(2 \mathrm{H}, \mathrm{m}), 6.23(1 \mathrm{H}, \mathrm{d}, J=3.3 \mathrm{~Hz}), 6.27$ $(1 \mathrm{H}, \mathrm{dd}, J=1.8,3.3 \mathrm{~Hz}), 6.80-6.88(3 \mathrm{H}, \mathrm{m}), 7.23-7.42(7 \mathrm{H}$, m), $7.45-7.58(2 \mathrm{H}, \mathrm{m}), 7.68(2 \mathrm{H}, \mathrm{d}, J=8.0 \mathrm{~Hz}), 7.98(2 \mathrm{H}, \mathrm{d}$, $J=8.0 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 13.7,42.3$, $50.1,55.2,78.5,107.3,110.3,113.9,127.1,128.4,128.5$, $128.7,129.5,130.6,131.1,132.8,134.4,142.2,152.6$, 159.5, 165.3, 166.4; IR (neat): $\nu 3346,2935,1720,1657$, 1514, 1269, 1252, 1111, 808, $712 \mathrm{~cm}^{-1}$; HRMS (FAB): $[\mathrm{M}-\mathrm{OBz}]^{+}$calcd for $\mathrm{C}_{22} \mathrm{H}_{22} \mathrm{NO}_{3} 348.1600$, found 348.1610; $[\alpha]_{\mathrm{D}}^{22}+10.5$ (c 0.58, MeOH).
4.6.5. ( $1 S, 2 S, 3 S$ )-Benzoic acid 3-benzoylamino-3-methoxycarbonyl-1-(4-methoxyphenyl)-2-methylpropyl ester (18). To an aqueous solution (AcOEt 1.0 mL and water 0.25 mL ) of $17(8.1 \mathrm{mg}, 0.017 \mathrm{mmol})$ was added $\mathrm{RuO}_{2}(1.0 \mathrm{mg}, \quad 0.0075 \mathrm{mmol})$ and $\mathrm{NaIO}_{4}(46 \mathrm{mg}$, 0.22 mmol ) at $-6{ }^{\circ} \mathrm{C}$. After stirring the reaction mixture for 2 h at this temperature, the reaction was quenched by the addition of 1 N HCl solution. The organic materials were extracted with $\mathrm{CHCl}_{3}$ three times, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and
filtered. After removal of the volatile materials under reduced pressure, the crude materials were dissolved in $\mathrm{Et}_{2} \mathrm{O}$. To an $\mathrm{Et}_{2} \mathrm{O}$ solution of crude carboxylic acid was added an $\mathrm{Et}_{2} \mathrm{O}$ solution of diazomethane at $0^{\circ} \mathrm{C}$. After 10 min at this temperature, the volatile materials were removed under reduced pressure and the crude methyl ester was purified by thin-layer chromatography $\left(\mathrm{Et}_{2} \mathrm{O} / \mathrm{HCO}_{2} \mathrm{H} /\right.$ benzene $=1: 1: 3$ ) to afford methyl ester 18 in $47 \%$ yield over two steps.

Colorless oil; ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.88(3 \mathrm{H}, \mathrm{d}$, $J=7.1 \mathrm{~Hz}), 2.86(1 \mathrm{H}$, dqd, $J=2.8,7.1,9.8 \mathrm{~Hz}), 3.75(3 \mathrm{H}$, s), $3.77(3 \mathrm{H}, \mathrm{s}), 5.31(1 \mathrm{H}, \mathrm{dd}, J=2.8,9.0 \mathrm{~Hz}), 5.69(1 \mathrm{H}, \mathrm{d}$, $J=9.8 \mathrm{~Hz}), 6.66(1 \mathrm{H}, \mathrm{d}, J=9.0 \mathrm{~Hz}), 6.84(2 \mathrm{H}, \mathrm{d}, J=$ $8.7 \mathrm{~Hz}), 7.30-7.45(6 \mathrm{H}, \mathrm{m}), 7.47-7.55(2 \mathrm{H}, \mathrm{m}), 7.72$ $(2 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz}), 8.02(2 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 12.7,41.3,52.7,53.6,55.2,77.4$, 113.9, 127.1, 128.4, 128.5, 129.6, 130.4, 131.7, 132.9, 134.0, 159.5, 165.4, 167.3, 172.3; IR (neat): $\nu 3375,2926$, $1739,1724,1668,1514,1252,1215,1109,1026,837$, $712 \mathrm{~cm}^{-1}$; HRMS (FAB): $[\mathrm{M}-\mathrm{OBz}]^{+}$calcd for $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{NO}_{4} 340.1549$, found: $340.1526 ;[\alpha]_{\mathrm{D}}^{22}+22.0(c$ $0.19, \mathrm{CHCl}_{3}$ ).
4.6.6. (3S,4S,5R)-N-[5-(4-Methoxyphenyl)-4-methyl-2-oxo-tetrahydro-furan-3-yl]-benzamide (19). To a solution of $\mathbf{1 8}(5.0 \mathrm{mg}, 0.011 \mathrm{mmol})$ in $\mathrm{MeOH}(0.5 \mathrm{~mL})$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}(6.0 \mathrm{mg}, 0.044 \mathrm{mmol})$ at room temperature. After stirring the reaction mixture for 2.5 h at this temperature, the reaction was quenched by the addition of phosphate buffer. The organic materials were extracted with $\mathrm{CHCl}_{3}$ three times, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and filtered. After removal of the volatile materials under reduced pressure, the crude material was purified by thin-layer chromatography $\left(\mathrm{Et}_{2} \mathrm{O} / \mathrm{HCO}_{2} \mathrm{H} /\right.$ benzene $=1: 1: 3$ ) to afford lactone $\mathbf{1 9}$ in $84 \%$ yield.

Colorless oil; ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.24(3 \mathrm{H}, \mathrm{d}$, $J=6.4 \mathrm{~Hz}), 2.52(1 \mathrm{H}, \mathrm{qdd}, J=6.4,10.1,11.8 \mathrm{~Hz}), 3.80(3 \mathrm{H}$, s), $4.80(1 \mathrm{H}, \mathrm{dd}, J=7.7,11.8 \mathrm{~Hz}), 4.93(1 \mathrm{H}, \mathrm{d}, J=10.1 \mathrm{~Hz})$, $6.71(1 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz}), 6.90(2 \mathrm{H}, \mathrm{d}, J=7.7 \mathrm{~Hz}), 7.33(2 \mathrm{H}$, $\mathrm{t}, J=8.8 \mathrm{~Hz}), 7.42(2 \mathrm{H}, \mathrm{t}, J=8.0 \mathrm{~Hz}), 7.52(1 \mathrm{H}, \mathrm{t}, J=$ $6.5 \mathrm{~Hz}), 7.81(2 \mathrm{H}, \mathrm{d}, J=8.0 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR $(150 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ): $\delta 13.8,47.2,55.3,57.0,85.3,114.2,127.1,128.0$, 128.27, 128.31, 128.7, 132.1, 133.0, 160.3, 167.7, 174.4; IR (neat): $\nu 2926,2854,1780,1647,1516,1250,1174$, 831, $712 \mathrm{~cm}^{-1}$; HRMS (FAB): $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{NO}_{4}: 326.1392$, found: 326.1400; $[\alpha]_{\mathrm{D}}^{23}+9.5$ (c $0.13, \mathrm{CHCl}_{3}$ ).

## Acknowledgements

The authors are indebted to Professors Tohru Fukuyama and Hidetoshi Tokuyama of The University of Tokyo for their invaluable suggestions concerning the oxidation of furan and the usage of the ozone generator. This work was partially supported by Grand-in-Aid for Scientific Research on Priority Areas 16073219 from The Ministry of Education, Culture, Sports, Science and Technology (MEXT).
